You can use `<<{latex}>>...<<latex}>>` or `<<(latex)>>...<<latex)>>` to directly insert LaTeX code into your script; for example, you could use `<<(latex)>> LaTeX<<latex)>>` to obtain the  $\text{\LaTeX}$  logogram. Observe that we had to write

`LaTeX{}` here instead of

LaTeX to preserve the space between the logogram itself and the word 'logogram'—MKTS will not intervene to make that happen automatically, as a careful, scientific study has

xxx

demonstrated that this problem—preserving spaces following commands in a general way that does not rely on parsing  $\text{\LaTeX}$  source and is not going to muck with very deep  $\text{\TeX}$  internals—is NP-complete.

Another potential use of is to **COLORIZE!** your text, here done by inserting

```
<<(latex)>>{
color{red}<<latex)>>
```

```
COLORIZE!
```

```
<<(latex)>>}<<latex)>>
```

(with or without the line breaks) into the script.
